

ABOVE & BEYOND FOR QUALITY

Engineering outstanding solutions is at the heart of everything we do, and quality control plays a huge role in ensuring that every product we create performs to the highest possible standard. In fact, our quality control procedures are among the most stringent in the industry.

TESTING IN-PRODUCTION

We test every single pair of headphones we create against 10 key audio parameters, to ensure that we're always holding ourselves to the very best standards of audio quality. That's right. Every. Single. Pair.

[10] key audio parameters

TESTING POST-PRODUCTION

Once they're rolling off the assembly line, we select random units for further testing against an even greater number of parameters. It's during this phase that every function, part and action is tested – from the microphones, to the buttons, and even down to the software that powers the device. Our programming and engineering are so precise that, when selected at random from the assembly line, any left bud can pair with any right bud.

OUT-TESTING THE COMPETITION

This stringent 2-phase testing is unique to Jabra, helping us to deliver the outstanding audio quality that our headphones are so well-known for.
