

How do I optimize the audio settings for listening to music and watching videos?

You can optimize the audio settings on multiple devices.

Device equalizer - audio

Many smartphones and tablets have their own audio settings. Make sure to adjust the bass, mid-range, and treble settings to suit your preferred audio.

Connected device - maximum speaker volume

Depending on the smartphone or tablet audio settings, the maximum potential volume may be disabled due to default settings for hearing protection from the device manufacturer.

Music and video apps - audio

Many smartphone and tablet apps have their own audio settings, which are independent of the device audio settings. Check and adjust these app audio settings to improve the audio experience.
