

Jabra Pro 9450 Mono Flex

What is the range on my Jabra Pro 9400?

The Jabra Pro 9400 supports a maximum range of 150m* from the base to the headset. In practice, you may find the range to be somewhat shorter due to physical obstructions such as walls, windows, Wi-Fi, and electromagnetic interference.

The sound in your headset will slowly deteriorate as you move farther from the base. When you move back in range, the sound quality is restored. If you move beyond range while talking, you will lose all sound. However, your call will be held open at the base for 60 seconds, which gives you a chance to move back in range. After 60 seconds out of range, the current call will be ended.

If you remain out of range for a longer time, you may need to re-establish the DECT connection manually when you return, by docking the headset to the base.
