

What is the Audio Video Remote Control Profile (AVRCP)?

AVRCP provides the capabilities, using the buttons on the AVRCP supported device, to:

- Play music
- Pause music
- Stop music
- Skip to the next or previous track

Note: A smartphone that is paired with the AVRCP supported device must also support the same Bluetooth profile. Some AVRCP supported devices do not have buttons to support all features.

If a device supports AVRCP, it can control a music player that is installed, for example on a smartphone, only if the music player also supports AVRCP. The majority of music players do support AVRCP. Refer to the online information for your specific music player, computer, smartphone, or tablet to check whether it supports AVRCP.
