

## Jabra Evolve2 65 USB-C UC Mono - Black

### Why does the music pause on my Jabra Evolve2 65 when I lie down?

The music may pause in response to the movement of your lying down.

In normal use, taking the headset off and placing it on a flat surface will pause the music, and lifting the headset will resume the music.

When you lie down, the motion sensor detects a change in the position and angle of the headset, and may misinterpret this as your taking the headset off and placing it on a flat surface. This results in the music pausing. To resume the music, press the **Play/pause** button.
