What is an Electronic Hook Switch (EHS)?

An Electronic Hook Switch (EHS) is a cable solution that connects a wireless headset base and a desk phone. An EHS enables call control functionality directly on the headset, eliminating the need for a mechanical handset lifter.

Different phone manufacturers use different cables and EHS protocols, as there is no single standard for an EHS. Refer to the [Compatibility Guide](#) to check if your desk phone supports EHS, which EHS cable adapter is required, and the EHS protocol that should be configured.
